

# QSort for cucumbers

products

## GREEFA

Greefa has specialized in the development and production of advanced sorting systems since 1952. Combining experience and expertise with the latest techniques and technological developments, Greefa produces durable and user-friendly sorting machines that are renowned all over the world. We gladly offer our customers total solutions, from infeed right up to packing.

Greefa has a great deal of experience in the field of horticulture. We have manufactured countless installations for tomato and pepper growers. We think along with our customers and help to find solutions for a wide range of sorting problems.

We have recently developed the QSort in close collaboration with a number of cucumber growers. This machine can sort (mini-) cucumbers, aubergines / egg plants and courgettes / zucchini according to length, weight and curvature.

## DESCRIPTION

The QSort is available with one or two lanes. The sorting machine has a speed of five carriers per second per lane.

All Greefa sorting installations are modular and innovative modules can be added at a later date. This holds true for the QSort too.

An intelligent sorting computer operates the QSort, making it simple to set the number of outlets as well as, for instance, the packing capacity per employee and per outlet.
